Navigocorpus, a new tool for the research in shipping and trade

Pierrick Pourchasse

The steady flow of ships entering large and small ports in early modern times has attracted an important amount of historical research generally concentrated on long-distance trade. This kind of analysis, which has certainly improved our understanding of the trade of a specific port, blots out the particularity of each voyage and does not allow more complex combinations. Navigocorpus is a data-base offering an important collection of data on merchant shipping between the 17th and the 19th centuries with the possibility to query on-line according to one's research interest, combining one or more criteria and allowing to see the existence of different systems.
